LITEPAPER

Communi3 is software that helps DAO's, P2E games and projects to manage and grow their communities.

It allows you to organise, engage and reward community members. We want the Web3 community to be more involved with our growth and become part of our journey.

Why is that important?

In today's world communities are managed through a variety of discord bots, spreadsheets and other loose structures which are very disjointed and become very work intense as soon as your community grows. It is very hard to keep track and incentivize people accordingly.

One thing every person in Web3 knows is that community is among if not the most important component of any successful project and endeavour.

How far are you in building this?

Actually the product is already built and functioning, we have been working on it for multiple years and originally it was meant to be deployed in the gaming space.

However Web3 is in a bigger need for our tools, and is way more exciting in general.

How were you able to build this for years?

We already raised $9M from conventional sources in the past and are a real company with x employees. We have a great team, our founders Brandon Byrne, who is a veteran of the gaming space, helping to build great companies like Curse and Team Liquid; and Andrew Ringlein who has experience in building tools for security and management for companies like HP etc.

Wait, if it is already built, are there already people using it?

Yes of course, we already have revenue and real customers.
Some of the more known ones would include projects like The Sandbox, Illuvium, YGG and Big Time; among many others.

So you mentioned we could become part of the journey?

Yes! We would love to have you onboard and there are multiple ways to do that.
We will launch an NFT collection of 10000 Community scientists that you will be able to mint on *Magic Eden*'s launchpad in the very near future.

Also you can take part in our upcoming IDO later this year. NFT holders will be able to stake their NFT's and there will be a meaningful allocation in the IDO reserved for NFT holders.

So what does that all mean?
You will be able to mint our scientists and be part of our journey to become the backend software for all communities in the Web3 space, as well as earning tokens in our IDO.
